Remove client should only be available to the main contact point. Is there a confirmation when the button is clicked?

1. Restricted to the Main Contact Point

Yes, client removal is now strictly restricted to the Main Contact Point.

- **Web UI Enforcement**:
  - When logged into an **Individual Client** site (`server_role = 'client'`), the **`[ × Remove Client ]`** button is completely hidden. Under the **Actions** column, rows display `Main Point only` (and `Current Host (Client)` for the local site), with explanatory text noting that installation management is restricted to the central Main Recipient Point.
  - Only when logged into the **Main Recipient Point** (`server_role = 'main'`) are the removal buttons rendered.
- **Server-Side Enforcement**:
  - The `remove_local_client` POST action handler verifies that the host site has `server_role === 'main'`. If an individual client attempts to post a removal request, it is rejected with:

    > *"Permission denied: Removing clients is only available to the main contact point."*

---

2. Confirmation When the Button is Clicked

Yes, there is an explicit confirmation prompt.

When the **`[ × Remove Client ]`** button is clicked on the Main Contact Point, `confirmClientRemoval()` intercepts the action and displays a browser dialog:

> **Are you sure you want to permanently remove client "<Client Name>" (<domain>) from the server registry and database?**
>
> • This removes configuration files and database entries for this client.
> • This action cannot be undone.
>
> **Click OK to proceed with removal, or Cancel to abort.**

- **Cancel**: Intercepts and stops the form submission (`return false`). No request is sent to the server and nothing is altered.
- **OK**: Executes the POST request to purge the client from the server registry (`installations.json`), configuration (`/etc/tricurse/<domain>/`), and database records (`contact.sqlite`).
