Remove drop down from subject in Send Mail Form. I can no longer expand letters that were rolled up.

There seems to be an error in the index.php syntax. I'm getting a javascript error. The To box is no longer present.

The JavaScript syntax error has been resolved, the **To** destination box is restored, letter expand/rollup functions smoothly, and browser autocomplete on the Subject line has been disabled.

Key Fixes Applied

1. **Restored the "To" Destination Box & Fixed JavaScript Syntax**
    - **Root Cause**: An orphaned `catch (err)` block remained at the end of the script tag following the horizontal archive PNG implementation, throwing `SyntaxError: Unexpected token '}'`. Because the script failed to parse, subsequent functions like `loadDefaultDestinations()` were blocked from initializing the **To** input field.
    - **Fix**: Removed the orphaned block. Verified all `<script>` tags using Node (`node -c`) with **0 syntax errors**. The destination rows now initialize and display as expected in index.php.
2. **Disabled Subject Field Dropdown / Autocomplete**
    - Added `autocomplete="off" autocorrect="off" autocapitalize="off" spellcheck="false"` to the Subject input:

```
<input type='text' id='subjectInput' name='subject' autocomplete='off'
autocorrect='off' autocapitalize='off' spellcheck='false'>
```

    - This eliminates browser history popups and dropdown suggestions when clicking into the Subject field.
3. **Fixed Letter Expansion & Rollup Desynchronization**
    - Refactored `toggleMessageRollup(msgId)` in index.php to inspect the primary `.message-body-content` visibility state directly (`display === 'none'`).
    - Removed `.message-collapsible-section` from `.archive-omitted-body-notice` so that notices do not conflict with letter rollups or trap letters in an unexpandable state.
4. **Synchronized and Committed**

- Updated and verified across all active server paths:
  - tricurse/contact/index.php
  - addressbar.net/contact/index.php
  - `/var/www/html/contact/index.php`
- All PHP syntax (`php -l`) and JS syntax validations pass with zero errors. Changes are committed to git on `main`.
