Implement Download As PNG for individual messages.

The **Download As PNG** feature for individual messages has been implemented across both the **Inbox** and **Archive** views.

Summary of What Was Implemented

1. **`[ 📷 Download As PNG ]` Action Button**:
    - Added to every message card's action toolbar in both the **Inbox** (received, sent copies, and delayed messages) and **Archive** lists.
    - Clicking the button provides instant feedback (`[ ⏳ Generating PNG... ]` $\to$ `[ ✓ Downloaded PNG! ]`).
2. **High-Resolution (2x Retina) Client-Side Canvas Renderer (`downloadMessageAsPng`)**:
    - Implemented in `index.php` using native HTML5 `<canvas>`.
    - **Zero Server Overhead & Zero Dependencies**: Renders completely in-browser with no server round-trips and no tainted canvas security issues.
    - **Complete Card Fidelity**: Captures the complete message layout styled in the authentic brass/amber retro terminal theme:
        - **Card Frame & Drop Shadow**: Deep dark background (`#11100f`), brass stamped border (`#7d6945`), and drop shadow.
        - **Header Bar**: Bold subject, sender / recipient (`From: ...` / `To: ...`), status badges (`✓ RECEIVED`, `[ 👥 Shared External Message ]`, `UNREAD`, etc.), and timestamp.
        - **Info Banners**: Preserves the Shared External Message original recipient banner and distribution lists (`To: Client A; Client B`).
        - **Message Body**: Dynamic word wrapping preserving multi-line paragraphs, indentation, and monospace font styling.
        - **Footer Bar**: Delivery/archive status and system branding watermark (`addr.bar federated contact • Message #ID`).
    - Automatically names the file based on the subject and ID (e.g., `meeting-notice-#14.png`).

All changes have been tested and synchronized across `/addr.bar/tricurse/contact/`, `/addr.bar/addressbar.net/contact/`, and `/var/www/html/contact/`.
