If you click Reply on an external message, there should be a check to see if the address can receive a letter.

An automatic destination availability check has been added when clicking **Reply** on an external message:

1. Instant Pre-Flight Check on `[ ↩️ Reply ]` Click

When viewing an external message in the **Inbox** or **Archive** list and clicking `[ ↩️ Reply ]`:

- The button temporarily indicates `[ ⏳ Checking... ]`.
- It executes a pre-flight probe (`action=check_peer_availability`) to verify if the remote address can currently receive a letter.
- **If the address is available**: It transitions directly into the compose form.
- **If the address cannot receive a letter** (e.g., daily rate limit reached, communications toggled off, blocked, or endpoint offline):
  A warning dialog appears explaining why:

  > ⚠️ **Destination Availability Check:**
  > The address `"<sender_address>"` cannot currently receive letters:
  > • *Daily message limit reached (10 msgs/day). New messages will be delayed.*
  >
  > **Click OK if you still wish to proceed to the compose form, or Cancel to abort.**

  Clicking **Cancel** keeps you in your inbox so you don't spend time writing a letter to an address that cannot receive it.

---

2. Auto-Check on the Reply Compose Form

When the compose form loads with the pre-filled `reply_url` (whether clicked normally or opened in a new tab):

- `checkRowAvailability()` runs automatically on the recipient row.
- The live status badge and remaining message quota are displayed directly below the recipient field:
  - `🟢 Available: Website is online and available to receive messages. (X msgs remaining today)`
  - or `⏳ Rate Limited: Daily message limit reached (10 msgs/day). New messages will be delayed.`
