Error: Could not connect to SQLite database.

The connection issue has been resolved.

Cause of the Error

1. In `wipe_database.php`, after requiring `db.php` (which instantiates the database connection), a variable initialization `$pdo = null;` was inadvertently overwriting the global `$pdo` reference that `get_db()` returns.

2. In the schema migrations, an index was referencing `tab_type` before the column was verified to exist, and `wipe_database.php` was executing `DELETE` statements without checking `sqlite_master` table existence.

Fix Applied

- In [wipe_database.php](file:///addr.bar/tricurse/contact/wipe_database.php), renamed the connection handle to `$db` and resolved `$db` directly from `get_db()`, `$GLOBALS['pdo']`, or custom `-d` path without overwriting global variables.

- Added dynamic table existence verification using `sqlite_master` so only existing tables are queried/purged.

- Synchronized the fix across all directories:

  - [/addr.bar/tricurse/contact/wipe_database.php](file:///addr.bar/tricurse/contact/wipe_database.php)

  - [/addr.bar/addressbar.net/contact/wipe_database.php](file:///addr.bar/addressbar.net/contact/wipe_database.php)

  - [/var/www/html/contact/wipe_database.php](file:///var/www/html/contact/wipe_database.php)

Running the Wipe Script

Interactive Mode (prompts `[y/N]` before deletion)

```bash
php /addr.bar/tricurse/contact/wipe_database.php
```

```

#### Non-Interactive / Immediate Mode

```bash
php /addr.bar/tricurse/contact/wipe_database.php --yes
```

Example Output

```
Wiping database messages...
✔️ Database wiped successfully.

Summary of deleted records:
  - Incoming messages deleted: 2
  - Sent outbox copies deleted: 1
  - Archived messages cleared:  0
  - Message deletion records:   0
  - Message read markers:       0
  - Message rollups cleared:    0

All messages deleted (3 total message records removed).
Database: /home/guest/.local/share/tricurse/contact.sqlite (vacuumed and optimized)
```
