The main contact point's name wasn't included to be set during the process of updating names.

The main contact point has been incorporated into the name-updating process across all administrative workflows:

Changes Implemented

1. **Simultaneous Updater (`contact_update_all` / `install.sh --update-all`)**:
    - Removed the `role !== "client"` filter during the missing names check in `install.sh`.
    - If the main contact point does not currently have a name set, `contact_update_all` lists it alongside client accounts with the badge `[Main Contact Point]` and prompts the administrator to configure its name:

```
Notice: Found 2 existing account(s) without a name set:
  1) main.example.com [Main Contact Point] (/var/www/html/contact)
  2) client.example.com [Client Account] (/var/www/client)
A name must be set for each account (including the main contact point
and clients).
```

2. **Dedicated Name Update Utility (`update_client_name`)**:
    - Updated `update_client_name.php` so `$clients` includes all registered server accounts (both the main contact point and client accounts).
    - `update_client_name -l` lists the main contact point clearly with role `Main Contact Point`.
    - The interactive menu displays `[Main Contact Point]` next to the main domain.
    - Senders can update the main contact point name directly via:

```
update_client_name -D <main_domain> -N '<name>'
```

    - Persists updates across `site_settings`, `users`, `/etc/tricurse/<domain>/contact.conf`, and `installations.json`.
3. **Installation Script Initial Setup (`install.sh`)**:
    - Updated `install.sh` so that when installing the main contact point (`ROLE="main"`), the administrator is prompted to configure a name for the main contact point rather than leaving it optional/blank.
4. **Server Installation Lister (`contact_list`)**:
    - Updated `contact_list.php` so that any installation (including the main contact point) without a configured name displays `(not set)` under the `Name` column.

Verification & Synchronization

- Verified interactive and non-interactive name updates for the main contact point via automated test harnesses.
- Synchronized all updated files to:
  - `/usr/local/bin/update_client_name`
  - `/usr/local/bin/contact_list`
  - `/addr.bar/addressbar.net/contact/`
  - `/var/www/html/contact/`
- Committed changes to git repositories in `/addr.bar/tricurse/contact` and `/addr.bar`.
