Client archive should ONLY contain letters that are ONLY visible to the client. (If at one point the letter was only visible to the client, but later revealed, there should be a copy in both tabs. The Revealed tab will include two dates, as mentioned). If a client letter to an internal recipient makes it visible to all other recipients, it's a group letter. A message correspondence with an external website involving one client isn't visible to the group. Inner-server letters are all group letters.

Updates Implemented

The rules for letter visibility, tabs, and archives have been updated in db.php and index.php, synchronized to addressbar.net/contact and /var/www/html/contact/, and committed to git:

---

1. Client Tab & Client Archive Scoping

- **Strict Client-Only Visibility**:
  - The **Client** tab and **Client Archive** contain **ONLY** private correspondence with external websites involving the client (incoming messages received directly from external sites and outgoing sent copies to external sites).
  - External correspondence with other clients, inner-server letters, and Central Transmitter broadcasts are strictly excluded from a client's tab and archive.

---

2. Dual Copies for Revealed Client Letters

- **For the Original Client**:
  - If an external letter was originally received or sent by Client A, it was at that point only visible to Client A.
  - When that letter is subsequently revealed to the server group (`shared_with_group = 1`), **a copy exists in both tabs**:
    1. **Client Tab / Archive**: Client A retains their copy in the Client tab (and Client Archive when archived), ordered by receipt date.
    2. **Revealed Tab / Archive**: A copy appears in the Revealed tab (and Revealed Archive when archived), ordered **at the date of revelation**.
- **Dual Date Display on Revealed Tab**:
  - The Revealed tab and Revealed Archive display both dates:
    1. 📅 **Original Received**: when the external letter arrived.
    2. 👁️ **Date of Revelation**: when the letter was revealed to the group.
- **For Other Server Clients (e.g. Client B)**:

- Because the letter was never only visible to Client B, it appears **ONLY in Client B's Revealed tab** (and Revealed Archive). It is never added to Client B's Client tab or Client Archive.

---

3. Inner-Server Letters Are Group Letters

- **Inner-Server Classification**:
  - Any letter between server clients (or where a client writes to an internal recipient) is classified as an **inner-server letter**.
  - As requested, all inner-server letters are treated as **Group Letters**:
    - They appear in the **Group tab** (and Group Archive) for all recipients in the group.
    - They never appear in the Client tab or Client Archive.
- **External Correspondence Isolation**:
  - Correspondence with an external website involving one client is not visible to the rest of the group unless explicitly revealed.

---

4. Database Schema & Archive Independence

- **Compound Primary Key for `message_archives`**:
  - `message_archives` now uses `PRIMARY KEY (message_id, domain, tab_type)`. This allows a revealed letter to be archived independently in the `client` archive and in the `revealed` archive without SQL constraint collisions.
- **Tab-Aware Query Filtering**:
  - Archival exclusions and page queries now filter specifically by `tab_type`, ensuring that archiving a client copy does not prematurely remove the letter from the active Revealed tab (and vice versa).
