List the main contact point on the index page of the server's clients, so a visitor can see it.

The server's **Main Contact Point (Server Group Transmitter)** is now displayed on the public index landing page (`index.php`) of the server's client websites so any visitor can see it.

What Was Implemented:

1. **Public Main Contact Point Display for Visitors** (`index.php`):
    - On client websites (`$server_role === 'client'` or when connected to a separate main endpoint), the public index page prominently displays the **Main Contact Point (Server Group Transmitter)** block directly beneath the direct website contact instructions.
    - Displays the main contact point's preset name (if configured) and cleanly formatted canonical address (stripped of `https://` and `/index.php` via `format_address_display()`).
    - Includes the guidance notice: *"You can mail the transmitter if there's no specific contact point. The main contact point serves that function and can broadcast to the group."*
    - Includes a one-click `[ 📋 Copy Main Contact Point Address ]` clipboard button.
    - For the main contact point website itself, displays a badge indicating it operates as the central contact point and transmitter for the server group.
2. **Public Header & Desktop Badge Updates** (`index.php`):
    - Shows the preset name and role (`[ Client Account ]` vs `[ Main Contact Point ]`) in the directory banner and system login headers.
    - For authenticated host desktops, displays the associated main contact point address and name in the desktop banner.
3. **Documentation & Synchronization**:
    - Documented in README.md.
    - Synchronized across:
        - `/addr.bar/tricurse/contact/index.php`
        - `/addr.bar/addressbar.net/contact/index.php`
        - `/var/www/html/contact/index.php`
