Keep the bottom box, and include a page number in it, on all pages.

The subject should take up the full width it would normally use until it’s written. The date can be included after that. When the date is included, it should be on the far right. Remove bottom boxes from all pages. Remove the top box from pages after the first page.

Unless there is only one page. In that case, don't include a bottom box.

If a bottom box is included, there should only be a page number in it.

All requested layout updates for printable PNG exports have been implemented:

1. Subject & Date Placement in Box 1

- **Full Width Utilization**: The subject wraps using the full available width (888 px) until completely written.
- **Dynamic Date Placement**:
  - If there is sufficient room on the final subject line (at least 24 px gap between the end of the subject text and the date), the date is placed on that same line aligned to the far right.
  - If there is not enough room on that line, the date is placed on the next line down, aligned to the far right.
  - Box 1 expands vertically to accommodate all subject lines plus the date line if placed below.

2. Top Box on Continuation Pages

- Removed the top header/continuation box on all pages after the first page (`p > 0`). Text starts directly inside the top border.

3. Bottom Box & Page Numbers

- **Single-Page Messages**: If a message fits on one page (`totalPages === 1`), **no bottom box** is included, maximizing vertical room for the message body.
- **Multi-Page Messages**: If a message requires multiple pages (`totalPages > 1`), a bottom box is included on all pages containing **only the page number** (e.g., `Page 1 of 3`), with all status and branding labels removed.

4. Synchronization & Verification

- Synced across tricurse/contact/index.php, addressbar.net/contact/index.php, and html/contact/index.php.
- Validated clean PHP and JavaScript syntax.
