Update README.md.

`README.md` has been updated and synchronized across all deployment directories (`/addr.bar/README.md`, `/addr.bar/tricurse/contact/README.md`, `/addr.bar/addressbar.net/contact/README.md`, and `/var/www/html/contact/README.md`).

Summary of Documentation Updates

1. **Inner Message Protection & Block Site Suppression**:
   - Documented that `[ 🚫 Block Site ]` is suppressed for all inner messages (server group clients, intra-server group letters, transmitter broadcasts, and loopback peers).
   - Documented communication control safeguards that disallow blocking inner server group sites.
2. **Message Archiving by Month & Year**:
   - Documented the `[ 📦 Archive Message ]` system replacing deletions, moving messages to dedicated archive lists (`tab=archive`) organized by month and year with period navigation, dropdown filtering, and one-click restoration to the inbox.
3. **Preset Destination Selection & Clean Address Formatting**:
   - Documented preset destination dropdown selection for local server clients when sending mail.
   - Documented the privacy protection rule excluding internal names on mail from external servers, and clean `To` and `From` formatting without protocol schemes (`https://`) or script filenames (`index.php`).
4. **Main Contact Point / Transmitter & Broadcasts**:
   - Clarified that all intra-server group letters are received across all group client inboxes.
   - Documented transmitter broadcasts reaching all subscribers without notification alerts unless the main contact point explicitly includes itself in the recipient list.
5. **Mandatory Administrator-Configured Client Names**:
   - Documented administrator-set client names via installation and the CLI tool `update_client_name` (with web UI input removed), including interactive name prompts in `contact_update_all`.
6. **Project Structure Updates**:
   - Added `merge_databases.php` and updated file descriptions across the repository file tree.
